

WHAT IS CLAIMED IS:

1.           A portable terminal comprising  
              a transmission part that transmits to  
information provision equipment or a server, a signal  
indicating presence at a prescribed location, indicat-  
ing presence of a communications counterparty at a  
prescribed location,  
              a reception part that receives from said  
information provision equipment or said server, a  
signal indicating the position of a moving body  
indicating that a moving body is approaching or is  
present at said prescribed location,  
              an alarm part that issues an alarm using the  
moving body in position signal received at said  
reception part, to indicate that said moving body is  
approaching or is present at said prescribed location,  
              a light detection part that detects the  
degree of brightness,  
              a part that decides whether or not to  
transmit a present in prescribed location signal that  
decides, using the brightness as detected by said light  
detection part, whether or not to send a present in  
prescribed location signal from said transmission part.
2.           A portable terminal according to claim 1  
wherein said transmit decision part transmits a present  
in prescribed location signal from said transmission  
part when the level of brightness detected by said  
light detection part is below a fixed level.

3. A portable terminal according to claim 2 wherein said fixed level can be set.

4. A portable terminal according to claim 1 wherein said light detection part can be detached from the main body of the portable terminal.

5. A portable terminal comprising  
a transmission part that transmits to information provision equipment or a server, a signal indicating presence at a prescribed location, indicating presence of a communications counterparty at a prescribed location,

a reception part that receives from said information provision equipment or said server, a signal indicating the position of a moving body indicating that a moving body is approaching or is present at a prescribed location,

an alarm part that issues an alarm using the moving body in position signal received at said reception part, to indicate that said moving body is approaching or is present at said prescribed location,

wherein if said reception part receives a specified presence signal from a specified portable terminal informing that the specified terminal is present or in close proximity to said prescribed location, said transmission part does not transmit said present in prescribed location signal.

6. An information provision system comprising a first portable terminal, a second portable terminal

that moves together with a moving body, information provision equipment and a server wherein

said information provision equipment notifies said server that said first portable terminal is near said information provision equipment when said first portable terminal is near said information provision equipment, and

said server uses the current position of said information provision equipment and information on danger affecting said current position to notify said second portable terminal that said first portable terminal is in a region of danger.
